

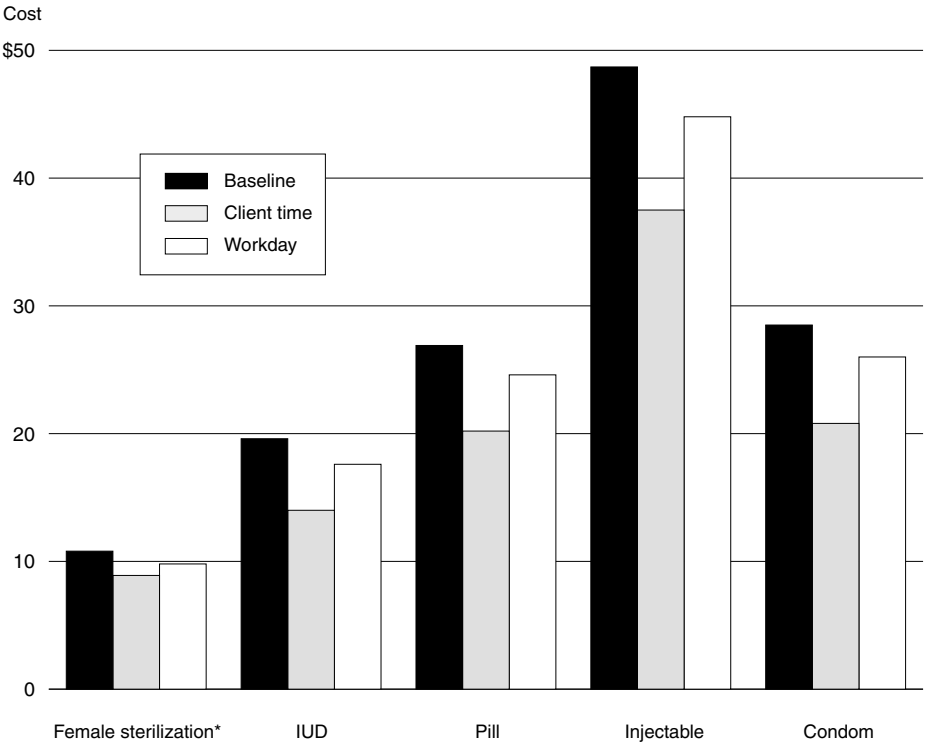

Figure 1. Baseline cost per CYP for selected contraceptive methods, and estimated costs after time spent with clients is increased or after the length of the workday is increased

*The cost estimates for female sterilization are weighted averages taking both the cost of the technique and its prevalence into account. Thus, the total baseline cost (\$10.80) represents 75.7% of female sterilizations being postpartum procedures (at \$8.30 per procedure) and 24.3% being interval procedures (at \$17.20 per procedure).
