

TABLE 3. Odds ratios (and 95% confidence intervals) from conditional logistic regression analyses comparing the odds of having had two or more lifetime sexual partners for pregnant versus never-pregnant women, separately for those with early sexual debut and later debut

Subgroup	Variable	Odds ratio
Early debut (N=339)		
Pregnant (vs. never-pregnant)	≥2 lifetime partners	3.23 (1.22–8.56)*
Later debut (N=408)		
Pregnant (vs. never-pregnant)	≥2 lifetime partners	0.88 (0.38–2.07)

*p<.05. Note: Each model controls for the covariates listed in Table 2.
