

TABLE 3. Odds ratios (and 95% confidence intervals) from logistic regression analyses assessing the association between reported risk and adaptive behaviors and preadolescents' intentions to initiate sexual intercourse in the next year, by source of report

Behavior	Youth	Parent
Trouble at home	1.42† (0.96–2.11)	2.13** (1.37–3.29)
Getting into fights	1.44* (1.03–2.03)	1.56† (0.99–2.45)
Trouble with the police	1.75** (1.22–2.51)	1.68† (0.93–3.04)
Alcohol consumption	2.26** (1.61–3.18)	1.41 (0.83–2.37)
Being very good at schoolwork	0.57* (0.37–0.89)	0.50** (0.33–0.75)

*p<.05. **p<.01. †p<.10. Note: Odds ratios are per unit increase in score for the behavior and reflect a youth's odds of being categorized as intending to engage in intercourse.
