

**TABLE 3. Adjusted odds ratios (and 95% confidence intervals) from multivariable logistic regression examining women's likelihood of having received four or more antenatal visits for their last pregnancy, by selected characteristics**

Characteristic	≥4 antenatal visits
<b>Age at first marriage</b>	
≤15 (ref)	1.00
16–19	0.42 (0.21–0.81)*
≥20	0.05 (0.01–0.38)*
Don't know	0.21 (0.11–0.42)*
<b>Parity</b>	
1 (ref)	1.00
2–3	3.31 (1.15–9.53)*
4–5	5.22 (1.73–15.71)*
≥6	2.63 (0.85–8.15)†
<b>Mother-in-law's greater perceived efficacy of the index woman</b>	1.34 (1.02–1.76)*

\*p<0.05. †p<0.10. Notes: ref=reference group. For indices, an odds ratio greater than one indicates that higher reporting of the construct is associated with increased odds of the outcome, while an odds ratio less than one indicates that higher reporting of the construct is associated with decreased odds of the outcome.
