

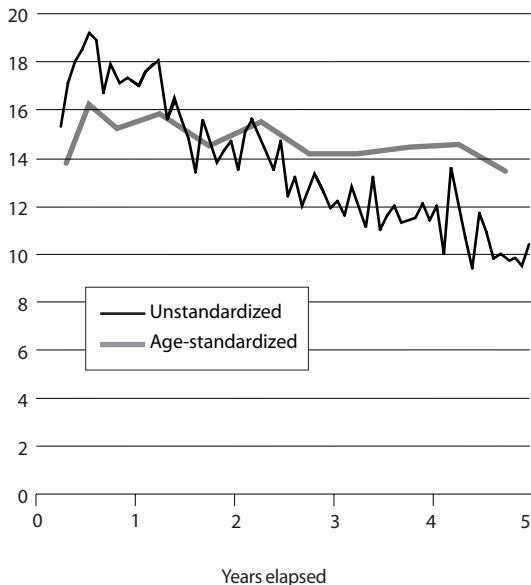

FIGURE 2. Monthly number of postpartum abortions per 1,000 person-years, by time elapsed since index birth

Monthly rate

Notes: Conceptions include pregnancies that ended in live birth, induced abortion or miscarriage. Age-standardized relative risks were estimated from a hazard regression model including time elapsed since index birth and age. They were converted to the absolute risk per 1,000 person-years using as the reference point the unstandardized rate at 19–24 months from the index birth.
